

Eiting an HTML page using Nvu on a PC computer.
2 Steps

This Step-by-Step explains the procedures for opening a file in Nvu that came from the Internet on a PC computer.

This Step-by-Step assumes that you have already copied the address of the file you wish to edit from your browser window. It also assumes that you have Nvu open.

- 1) Go to **File** and select **Open Web Location...**, and paste in the address copied from your browser (select the area and press Ctrl and v at the same time).

- 2) Select **Create** to open the file in Nvu. From here, you can edit the document as you wish.
